

Steps:

1. Review your partner's draft POP
2. Respond to the following questions:

<<WRITE A LOT!!!!>>

A. Rate the overall design/ease of navigation/readability of the POP

1 (very clunky/cold design) 5 (somewhat engaging) 10 (very engaging/friendly)

Overall Rating: 8

B. What are 2 things your partner can do to make their portfolio MORE readable?

(Bigger text? Smaller paragraphs? More photos?, etc)

Thing 1: One improvement would be to increase the font size in certain sections, such as the "About Me" and "Projects" pages. Currently, the text is a bit small compared to the amount of white space, which could make it harder to read on smaller screens or for those with visual impairments. Larger font sizes would not only improve readability but also add a sense of balance to the layout. Ensuring consistent font sizes throughout the website would also create a more professional and cohesive look.

Thing 2: Another way to improve readability would be to break up longer paragraphs into smaller, more digestible chunks. For example, on the "About Me" page, the large block of text could be split into two or three sections, each focused on a specific aspect like professional goals, personal background, or hobbies. Shorter paragraphs make it easier for readers to follow along without feeling overwhelmed. Additionally, incorporating bullet points for certain details, like goals or skills, could provide a quick, scannable format for key information.

C. Does the PROJECTS page feature all of the required items listed in the assignment description?

YES

NO

The "Projects" page appears to meet all the requirements. It includes descriptions of each project with sufficient detail about what was accomplished and the skills used. Additionally, there are accompanying visuals for each project, which enhance understanding and add a professional touch. However, it might benefit from a clearer organization, like categorizing the projects if there are several, to make the page easier to navigate.

D. Click all the links in the POP. Does each link take you to the correct place?

YES

NO

All links seem to work as intended, leading to the correct pages. The navigation bar is functional, and clicking on each tab (e.g., "Projects," "Resume") directs you to the respective sections without any errors. However, to make the links even more effective, consider adding hover effects or slight animations, which can provide visual feedback to the user and enhance the overall interactivity of the site. It's a small detail, but it can make a big difference in the user experience.

E. What is something you did on your POP that you recommend your partner do on theirs?

One feature I added to my portfolio that your partner could implement is a consistent use of visual separators or section dividers between content areas. For instance, on my site, I used colored banners or subtle lines to clearly distinguish sections like "Projects," "About Me," and "Contact." This helps to visually guide the user through the site and prevents the content from blending together. Adding these separators could improve the flow of your partner's portfolio and make it feel more polished and organized.

F. What are the 2 most important things your partner could do to improve their POP?

Thing 1: One major improvement would be to include more interactive elements, such as a slideshow or hover effects on the "Projects" page. Currently, while the text and images are informative, they are static and lack interactivity. For example, using a carousel feature to showcase project images or linking the images to additional project details would make the portfolio more engaging. Interactivity not only enhances user experience but also demonstrates technical skills in web development.

Thing 2: Another important improvement would be to focus on color consistency and styling throughout the website. While the white background is clean and professional, adding a cohesive color palette (such as using the same accent color for titles, borders, and links) would tie the design together. This would also help emphasize key elements like headings or call-to-action buttons. A more deliberate use of colors would elevate the website's visual appeal and make it look more professional.
